

How Can I Reduce High Blood Pressure?

By treating high blood pressure, you can help prevent a stroke, heart attack, heart failure or kidney failure. Here are steps you can take now:

- Lose weight if you're overweight.
- Eat a healthy diet low in total fat, saturated fat, trans fat, cholesterol and salt. Emphasize fruits, vegetables and low-fat dairy products.
- Be more physically active.
- Limit alcohol to no more than one drink per day for women or two drinks a day for men.
- Take medicine the way your doctor tells you.
- Know what your blood pressure should be and work to keep it at that level.

Many people have high blood pressure without knowing it. Once you know about your condition, though, you can reduce your risk and live a healthier life. It takes proper treatment and some changes in your lifestyle. But it's worth it!

How can I lose weight?

If you're overweight, you're putting too much strain on your heart. Talk with your healthcare professional about a healthy eating plan. When you lose weight, your blood pressure often

goes down! By eating a low-saturated-fat, low-cholesterol diet, you'll help avoid heart attack and stroke.

How do I limit salt?

Eating a lot of salt (sodium) adds to high blood pressure in some people. It holds excess fluid in your body and puts an added burden on your heart. Your doctor may tell you to cut down on the salt you use in cooking and not add salt to foods. He or she may also tell you to avoid salt completely.

Try to read food labels so you'll know which foods are high in sodium. And learn to use herbs or salt substitutes instead!

How do I limit alcohol?

Ask your doctor if you're allowed to drink alcohol, and if so, how much. Drinking more than two drinks a day if you're male or more than one drink a day if you're female may lead to high blood pressure. One drink is equal to

12 ounces of beer, 4 ounces of wine, 1.5 ounces of 80-proof distilled spirits or 1 ounce of 100-proof spirits. If cutting back on alcohol is hard for you to do on your own, ask about community groups that can help.

How can I be more active?

An inactive lifestyle is a risk factor for heart disease and stroke. It also tends to add to obesity, which is a risk factor for high blood pressure. Regular physical activity helps to reduce blood pressure, control weight and

reduce stress. It's best to start slowly and do something you enjoy, like taking walks or riding a bicycle. Talk to your healthcare professional about a good plan for you.

What should I know about medicine?

Your doctors may prescribe different types of medicine for you. Don't be discouraged if you need to take blood pressure medicine from now on. Sometimes you can take smaller doses after your blood pressure is under control, but you may always need some treatment.

What's most important is that you take your medicine exactly the way your doctor tells you to. Never stop treatment on your own. If you have problems or side effects with your medicine, talk to your doctor.

How can I learn more?

1. Talk to your doctor, nurse or other health-care professionals. If you have heart disease or have had a stroke, members of your family also may be at higher risk. It's very important for them to make changes now to lower their risk.
2. Call 1-800-AHA-USA1 (1-800-242-8721) or visit americanheart.org to learn more about heart disease.

3. For information on stroke, call 1-888-4-STROKE (1-888-478-7653) or visit StrokeAssociation.org.

We have many other fact sheets and educational booklets to help you make healthier choices to reduce your risk, manage disease or care for a loved one.

Knowledge is power, so *Learn and Live!*

Do you have questions or comments for your doctor?

Take a few minutes to write your own questions for the next time you see your doctor. For example:

Can I drink any alcohol?

How often should blood pressure be checked?
